(New Chapter)

Nueral Control and Coordination

LECTURE-1

Zoology

Dr Adil Altaf sir

Topics To Be Covered

1 INTRODUCTION Nueron and its types

Tommmorrow - 3:pm

→ Body is controlled by two systems.

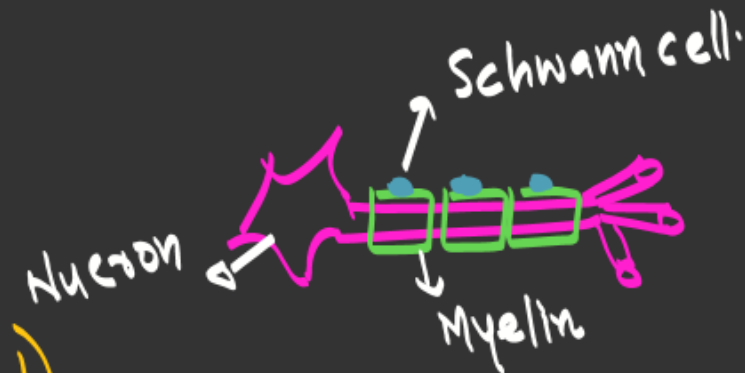

- ① Nervous System.
- ② Harmonal System.

→ Nervous System

→ Composed of Nervous tissue (Ectodermal)

→ Nervous Tissue is Made of two types of cells

- ① Neuron (Nerve cell).
- ② Neuroglial cells.

Neuron.

- Conducting cell.
(conducts signal)

4 Basic Tissue

- Epithelial
- Muscular
- Connective
- Nervous

Neuroglial cell.

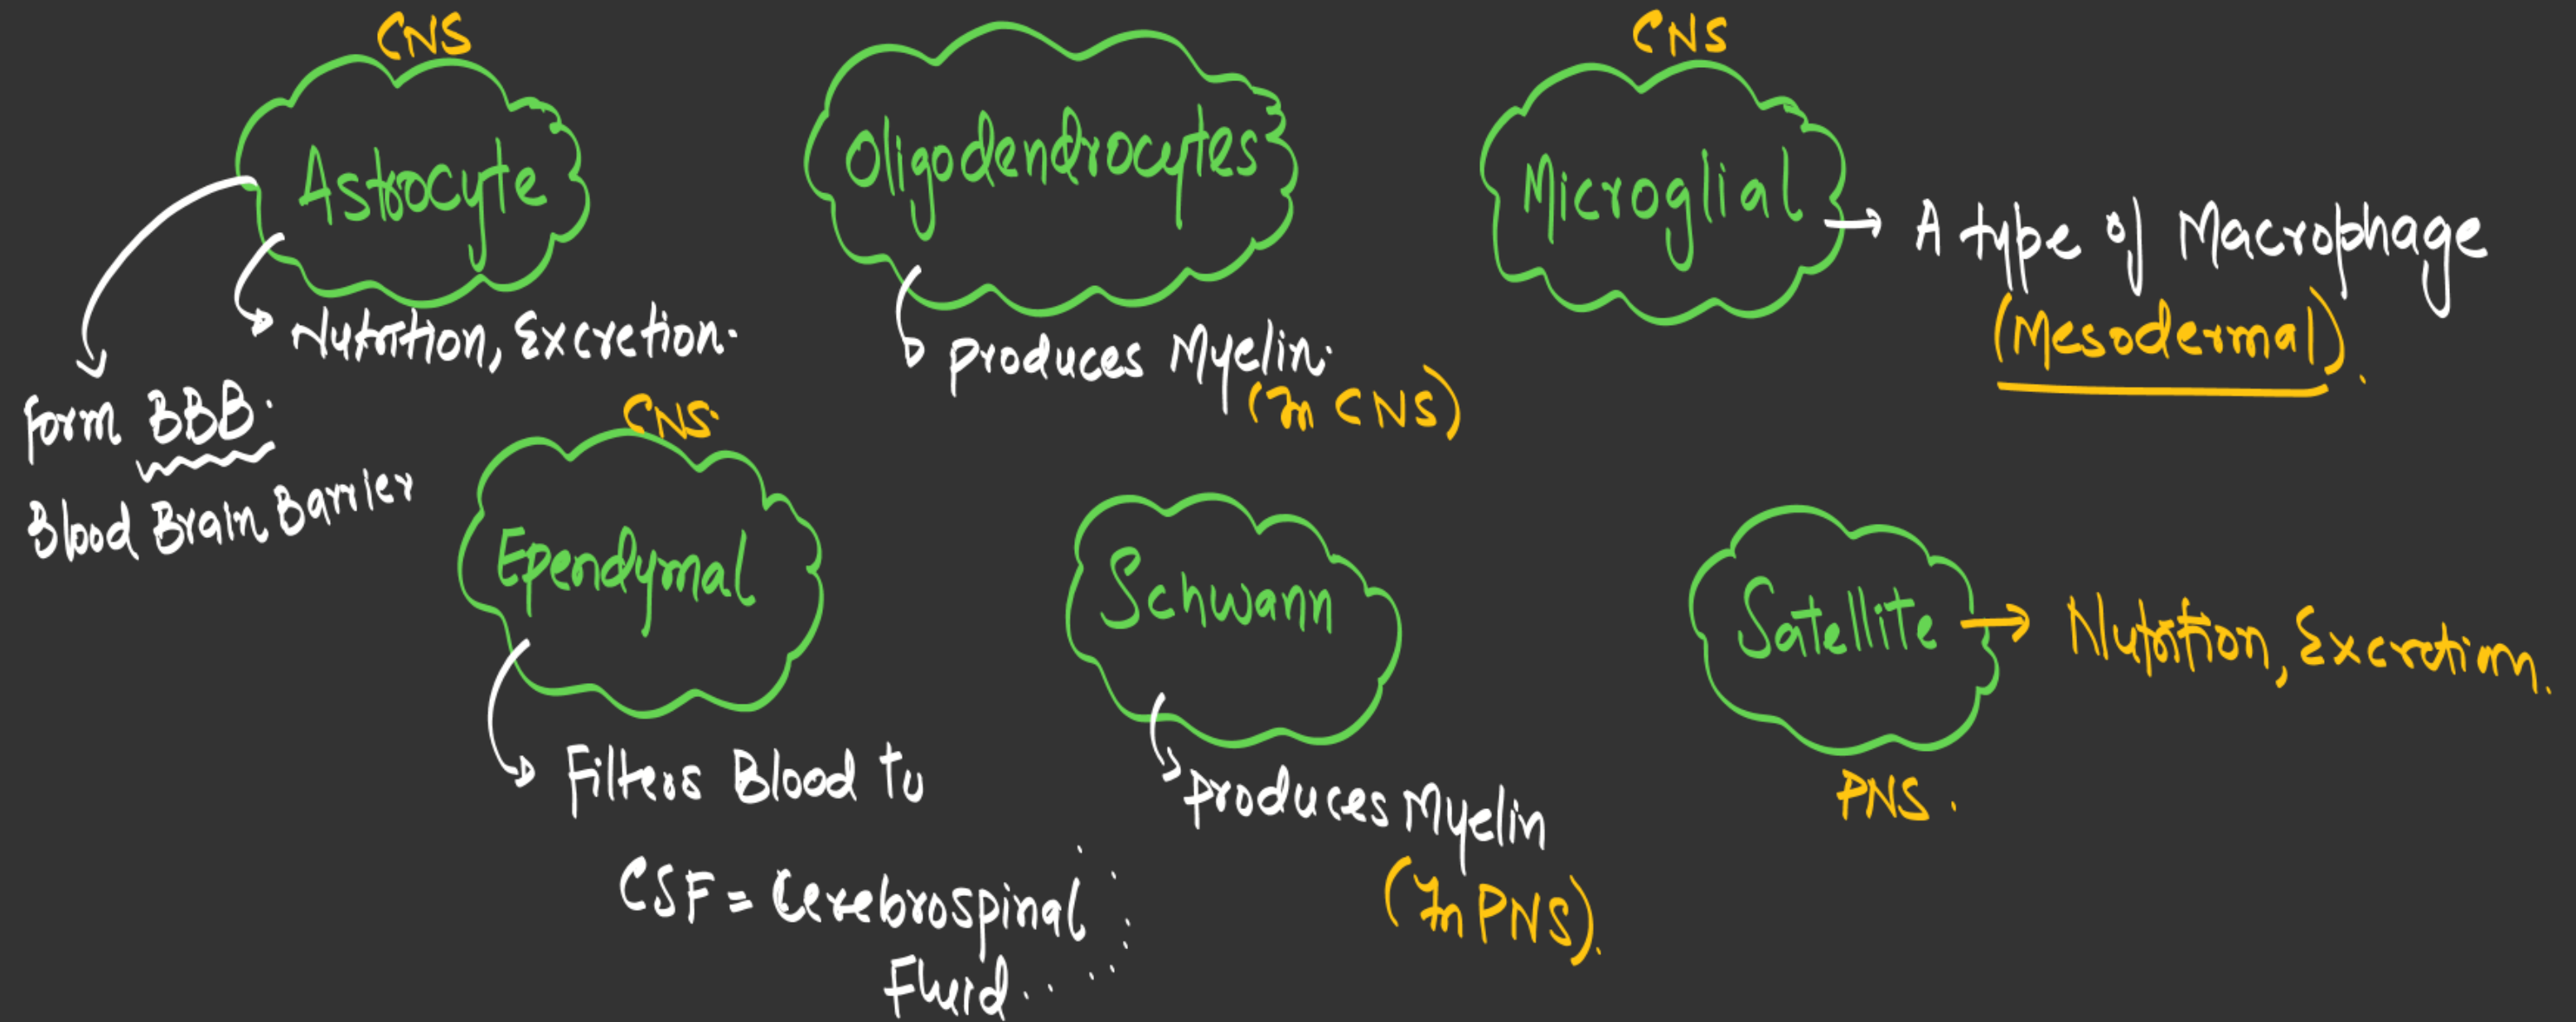

(to glue)

- Non-Conducting but Supporting cells.

e.g. Schwann cell

- More than 50% of Nervous Tissue by volume.

Examples of Neuroglial cells & their function:

- Neuron

- ↳ Klas Nerve cell.
- ↳ Conducting cell of Nervous System.
- ↳ Consists of:

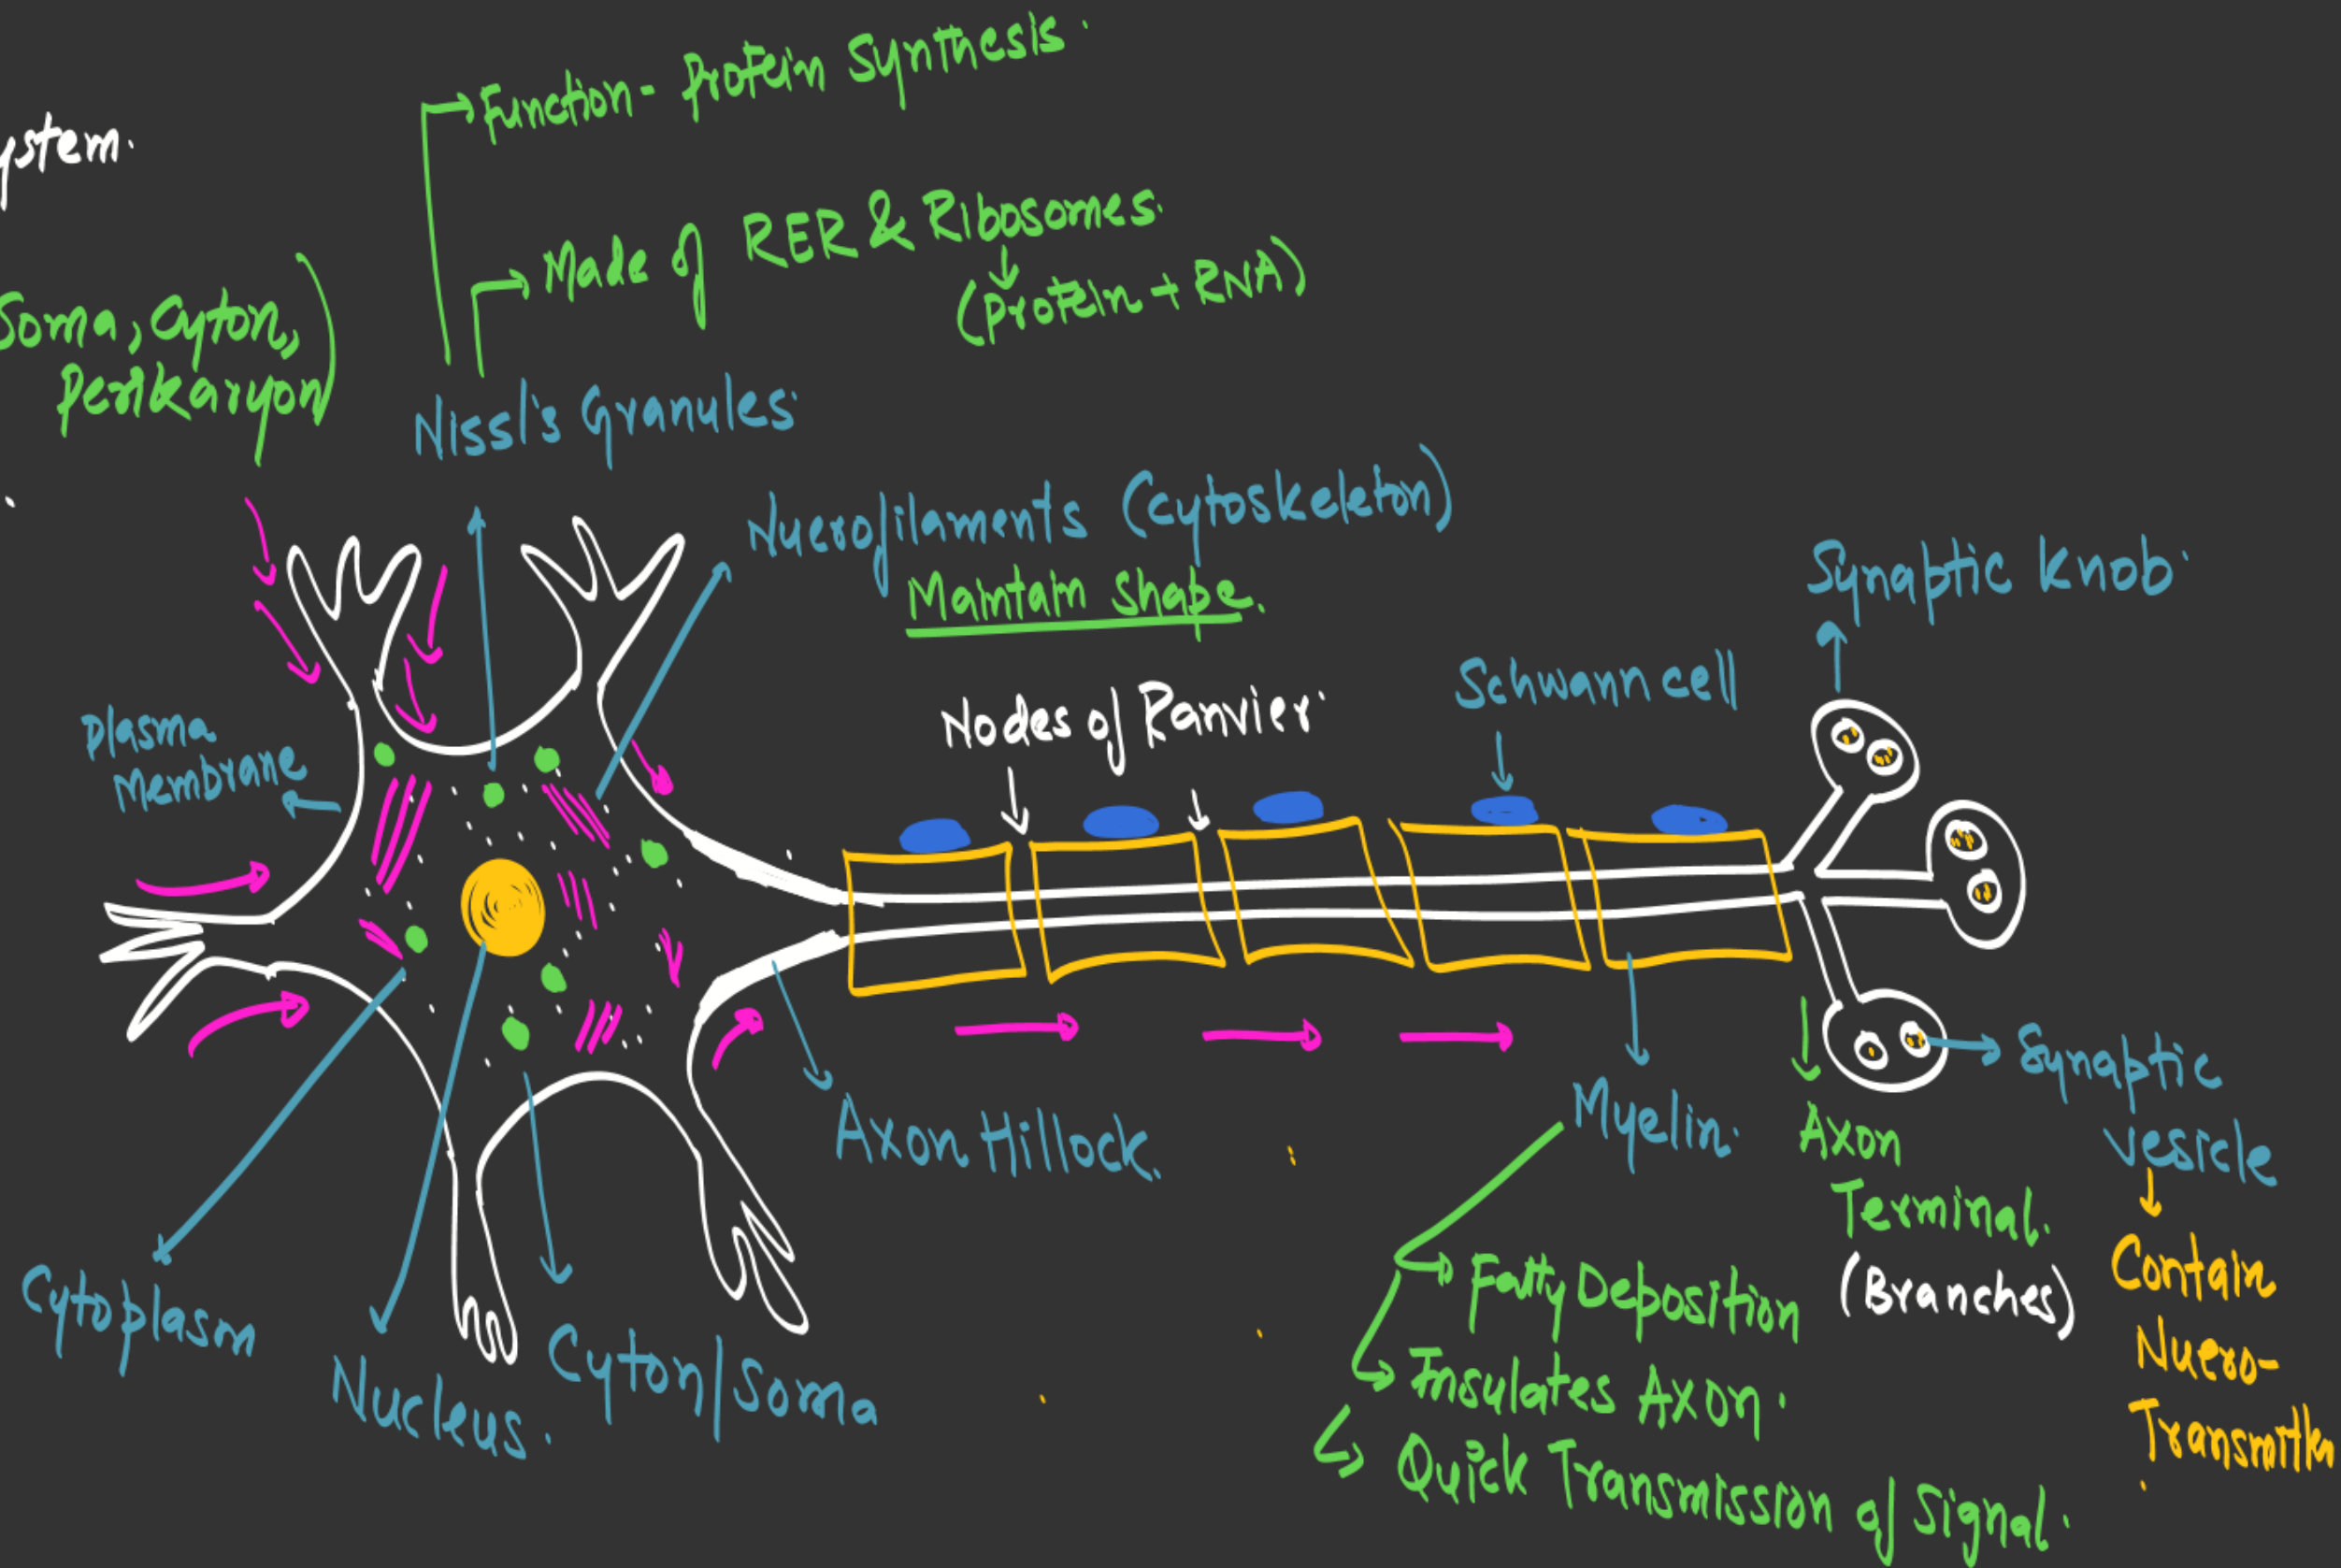

- ① cell Body (Also klas - Soma, Cyton, Perikaryon)
- ② Processes
 - Axon
 - Dendrites.

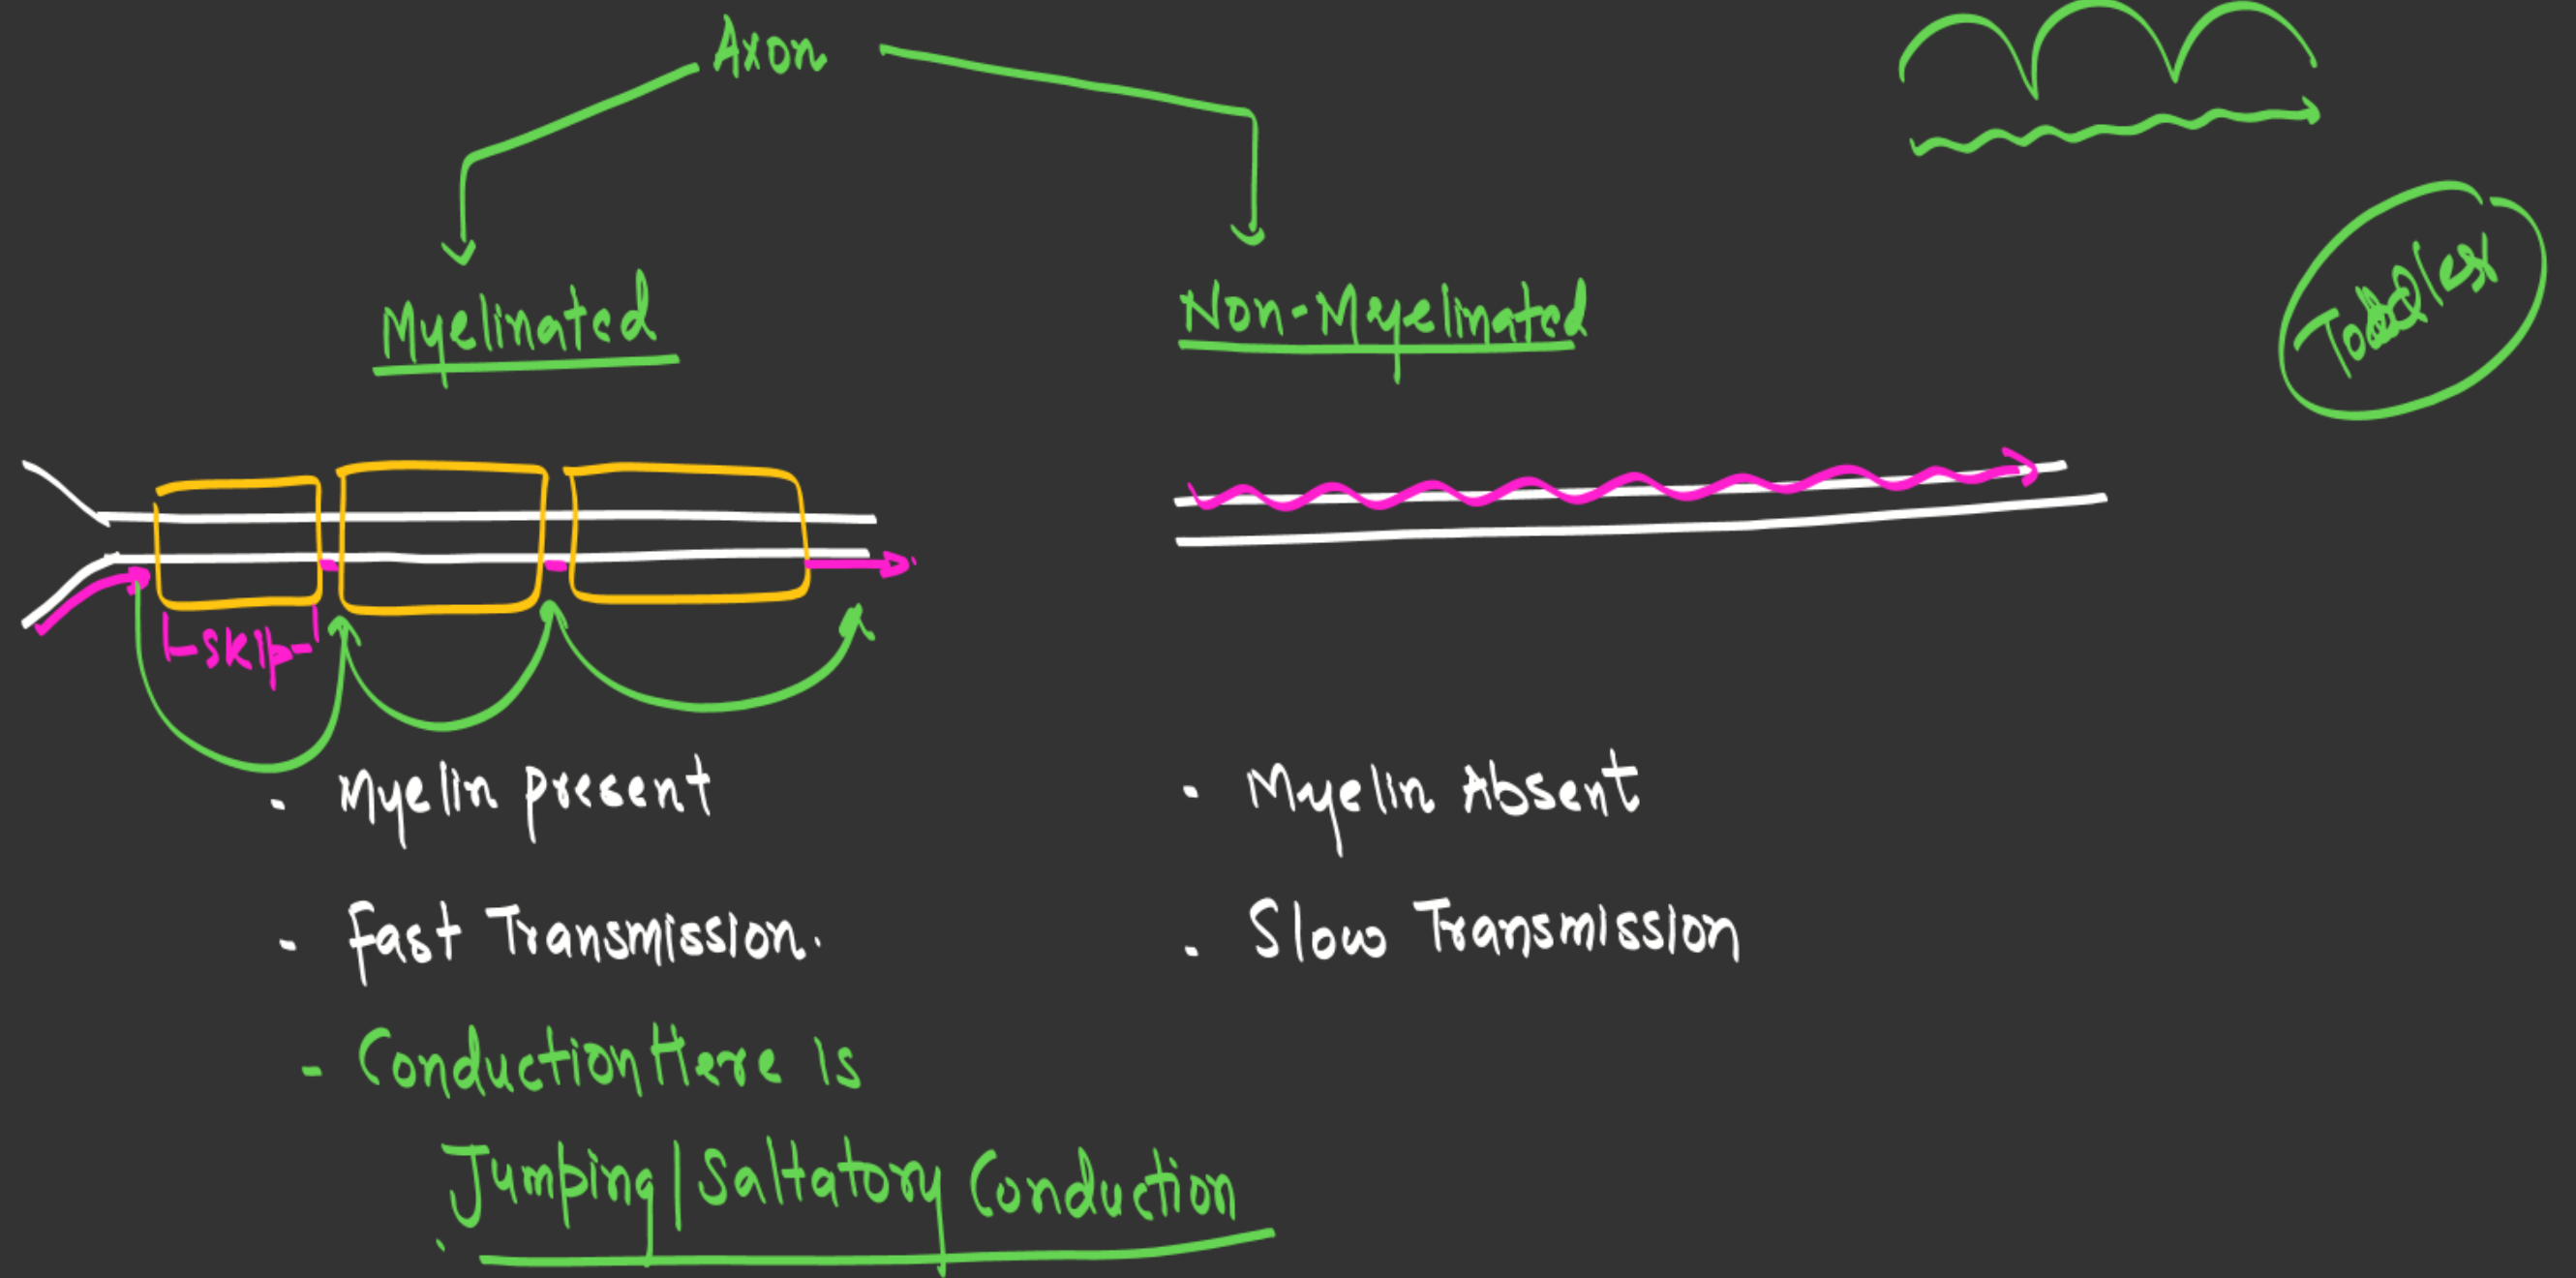

- Dendrite - Short process.

- Receive Signal & transfer to cell Body.
- Contain Nissl's Granules.
- Increase Surface Area.

- Axon - Long process.

- Takes Signal Away from cell Body.

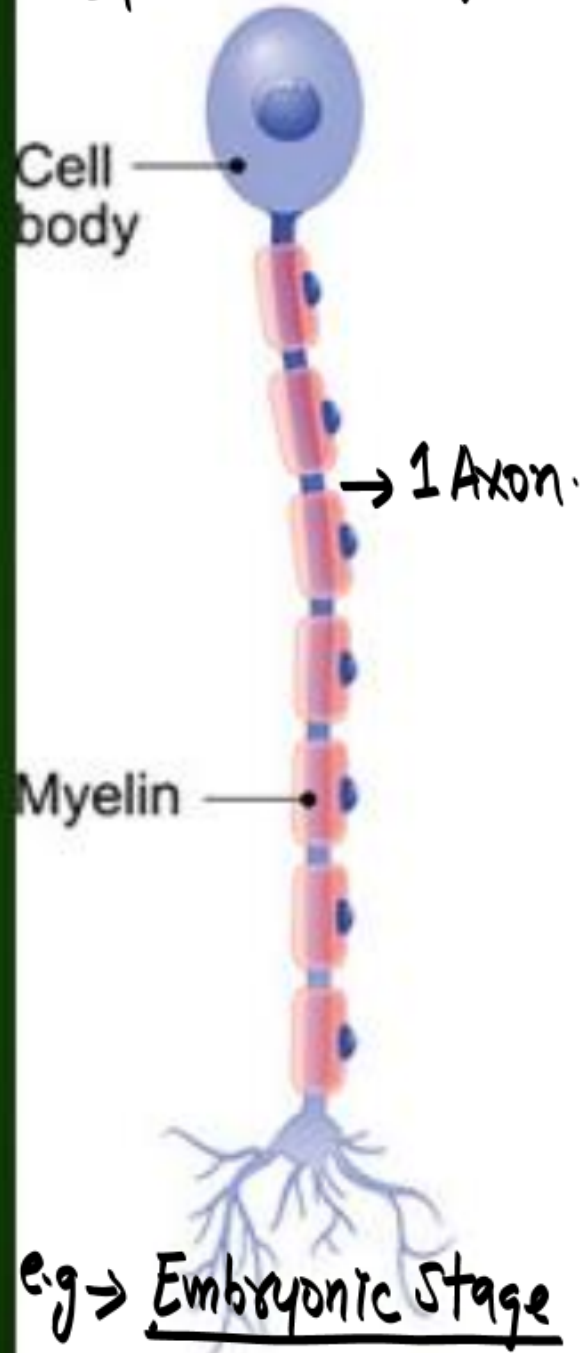

Types of Neuron's. (Basis of process)

Unipolar

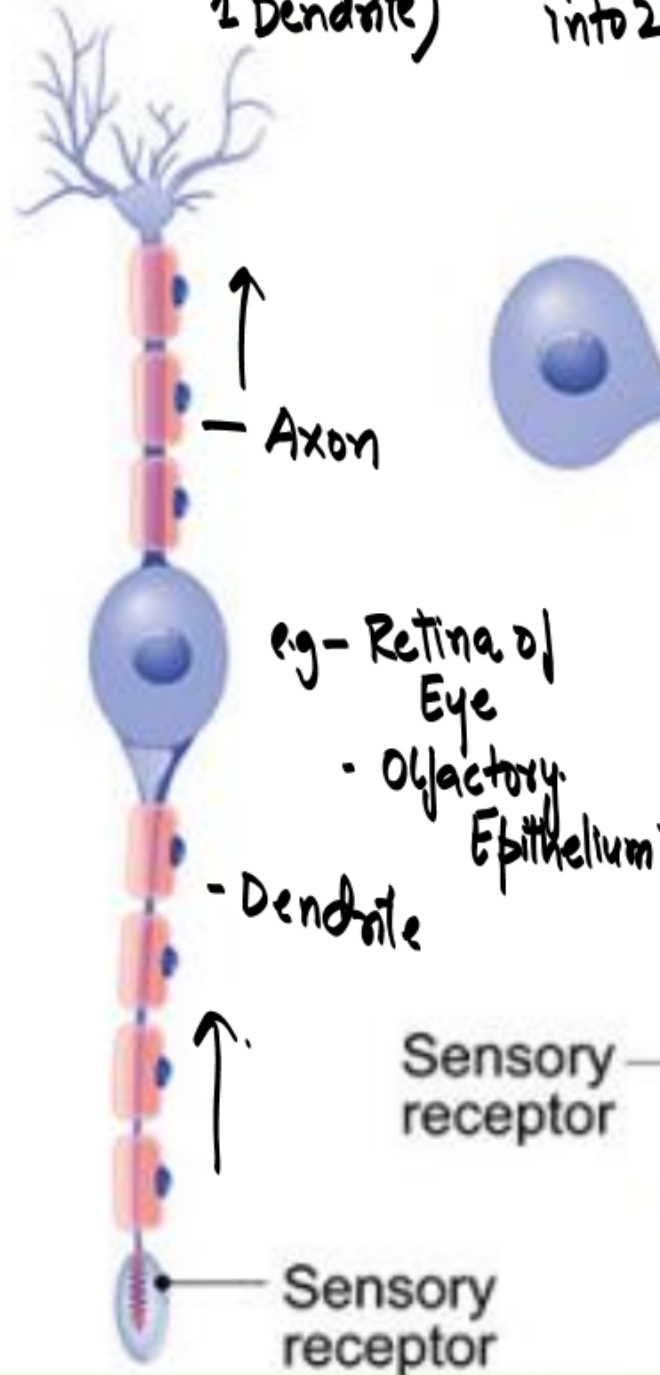

- 1 process - (Axon).

e.g → Embryonic Stage

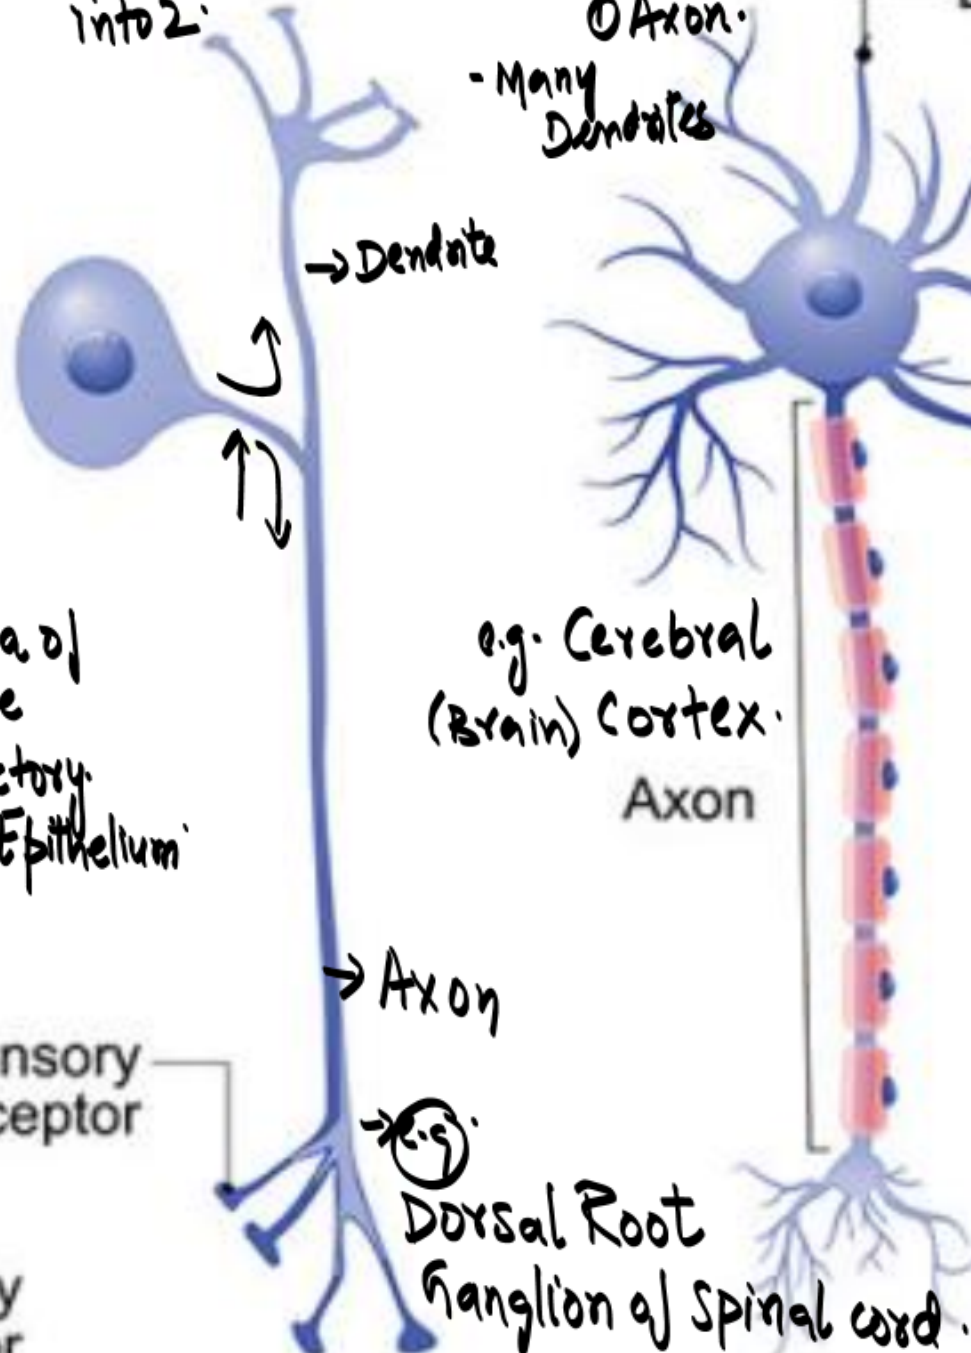

Bipolar

2 process (1 Axon
1 Dendrite)

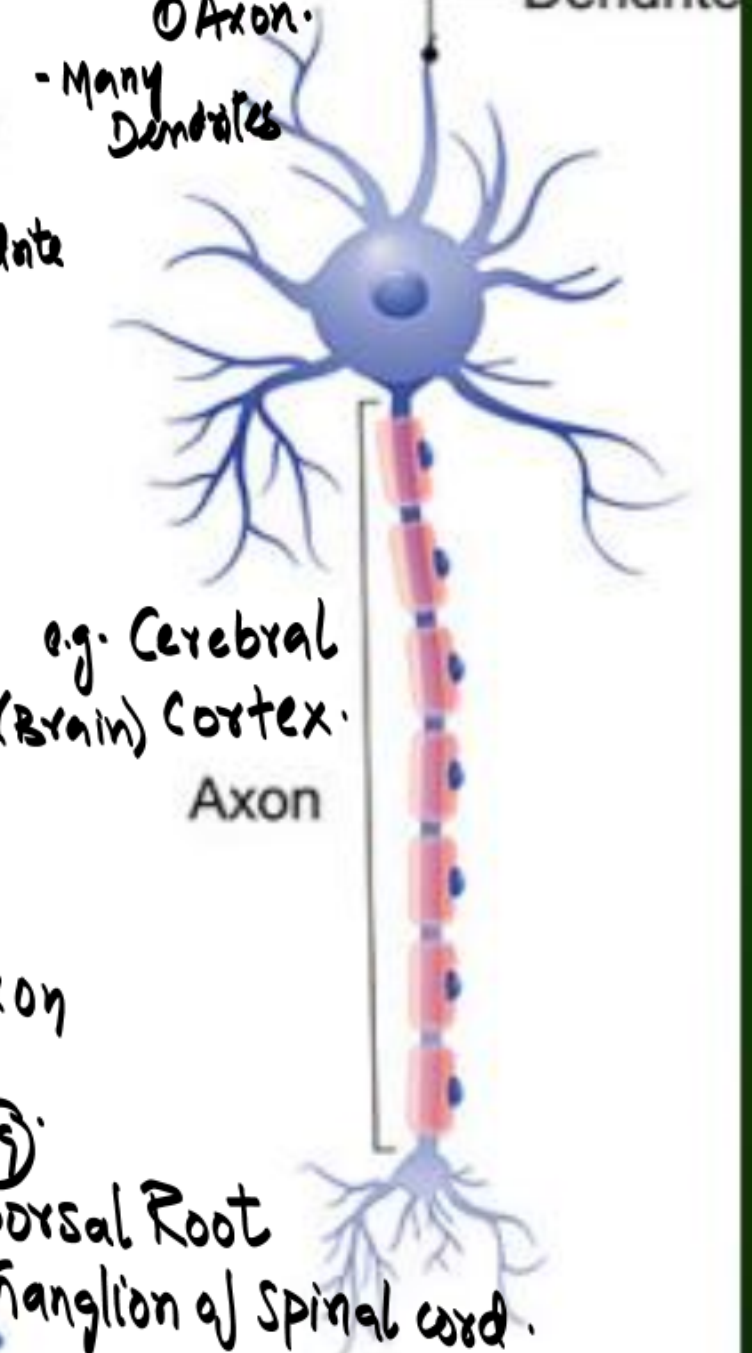

Pseudounipolar

- 1 process divides into 2

Multipolar

→ Multiple processes
1 Axon.

Also Apolar

- No-process

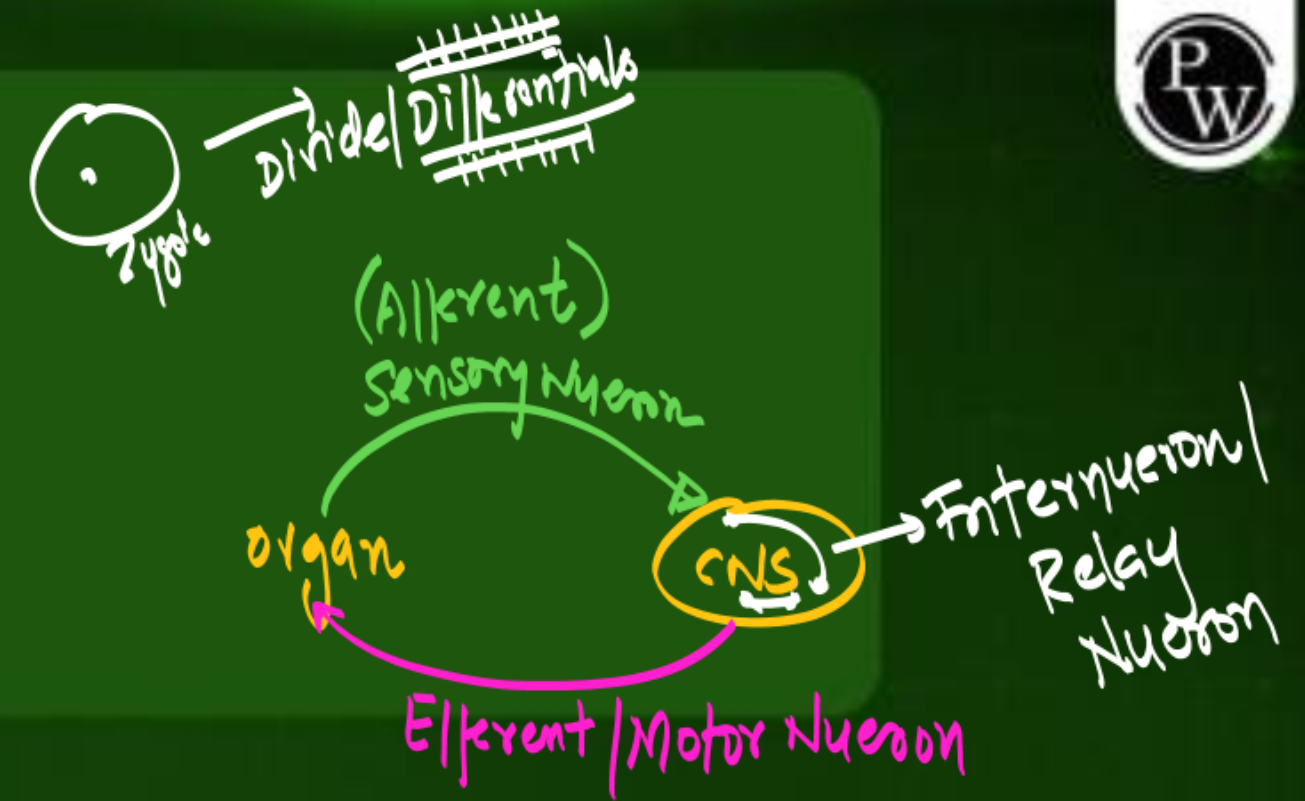

e.g Hydra

HOMWORK

→ H/W-

Sensory Neuron.
Motor Neuron
